

Simulation in Chemistry

General information

Asdrubal Lozada

Techniques

1. Stochastic Simulation
2. Molecular Dynamics
3. Quantum Chemistry
4. Edition & Visualization

This document provides an overview of computational simulation techniques commonly used in condensed matter physics, chemistry, and materials science. It also provides a lists the programs, software packages, or frameworks employed for such simulations.

Stochastic

- Melquiades (GPL) [Fortran]
- DL-Monte (BSD) [Fortran]
- Cassandra (GPL) [Fortran]
- GOMC (MIT) [C++]
- Dice (GPL) [FORTRAN]

Dynamics

- Gromacs (LGPL) [CPP]
- LAMMPS (GPL) [CPP]
- CP2K (GPL) [Fortran]
- Tinker (Tinker license) [Fortran - C]

Quantum

- CP2K (GPL) [Fortran]
- ORCA (Academic) [C]
- MOPAC (LGPL) [Fortran]
- Quantum Espresso (GPL) [Fortran]
- Octopus (GPL) [Fortran]
- XTb (LGPL) [Fortran]
- DFTB (LGPL) [Fortran]

Edit

- Molden (Molden license) [FORTRAN]
- Travis (GPL) [CPP]
- Gabedit (Gabedit license) [CPP]
- Jmol (LGPL) [JavaScript]
- Avogadro (GPL) [CPP]
- VMD (VMD license) [CPP]
- Molekel (GPL) [CPP]
- EasyHibrid (Open) [python]
